

Q. 1 Print customer name with highest number of orders.

Query:

```
select customer_name,customer_id,  
count(customer_id) as orders_placed  
from dmart_orders  
where payment_status='Paid'  
group by customer_id,customer_name  
order by count(customer_id) desc limit 1;
```

Screenshot:

Insights:

- Calculating the customer who placed order the highest time.
- While 'Rohan sharma' being the most regular customer with most paid orders.

Q. 2 Find total number of orders per category.

Query:

```
select product_category,  
count(quantity) as number_of_orders  
from dmart_orders  
group by product_category;
```

Screenshot:

The screenshot displays the MySQL Workbench interface. The SQL editor contains the following query:

```
110 (1095, 'C106', 'Anjali Desai', 'Dairy', 6, 20.00, '2026-02-17', 'Refunded'),  
111 (1096, 'C115', 'Gaurav Kapur', 'Packaged Foods', 9, 19.00, '2026-02-17', 'Paid'),  
112 (1097, 'C102', 'Priya Patel', 'Home Appliances', 1, 750.00, '2026-02-18', 'Paid'),  
113 (1098, 'C105', 'Vikram Singh', 'Apparel', 3, 160.00, '2026-02-18', 'Paid'),  
114 (1099, 'C108', 'Kiran Joshi', 'Personal Care', 5, 55.40, '2026-02-19', 'Pending'),  
115 (1100, 'C116', 'Arjun Kapoor', 'Groceries', 16, 12.50, '2026-02-19', 'Paid');  
116 select product_category,  
117 count(quantity) as number_of_orders  
118 from dmart_orders  
119 group by product_category;  
120
```

The Result Grid shows the output of the query:

product_category	number_of_orders
Groceries	23
Electronics	13
Apparel	14
Packaged Foods	16
Personal Care	13
Home Appliances	11

The Action Output pane shows the execution of the query, with a message indicating an error: "Error Code: 1055. Expression #1 of SELECT list is not in GROUP BY clause and contains nonaggregated column..."

Insights:

- Total products sold from each category including all payment status.
- Where 'Groceries' being the highest bought category and 'Dairy' being the lowest bought category among users.

Q. 3 Print revenue per order category:

Query:

```
select product_category,  
  
sum(quantity*price_per_unit) as total_revenue  
  
from dmart_orders  
  
where payment_status='Paid'  
  
group by product_category  
  
order by total_revenue desc;
```

Screenshot:

The screenshot displays the MySQL Workbench interface. The SQL Editor window contains the following query:

```
select product_category,  
sum(quantity*price_per_unit) as total_revenue  
from dmart_orders  
where payment_status='Paid'  
group by product_category  
order by total_revenue desc;
```

The Results window shows the output of the query as a table with two columns: product_category and total_revenue. The data is as follows:

product_category	total_revenue
Electronics	9929.75
Groceries	4670.70
Home Appliances	4330.00
Apparel	3934.98
Packaged Foods	2535.50
Personal Care	2254.26

The bottom panel shows the Output window with a list of actions and their execution details, including timestamps and durations.

Insights:

- Here the highest revenue where the status is 'Paid' is of 'Electronic' Category.
- While the lowest being 'Dairy' Category.
- The rate of 'Paid' customers is more in 'Electronic' category.

Q. 4 Find credit amount.

Query:

```
select sum(price_per_unit*quantity) as credited_amount from dmart_orders where payment_status='Paid';
```

Screenshot:

Insights:

- The product of quantity and price per unit gives the total price of the product.
- Among all 100 customers who shopped from dmart out of those some of them either refunded or the status is pending.
- So the total credited amount is 28668.
